

***2010 Tanner Street Utility Replacement Project
Project Update No. 8***

November 8, 2010

During the past week PACT Construction completed the water main connections at the intersection of Haddon Avenue, Euclid Avenue and Tanner Street. The completion of these connections, which is the last of the water main upgrades for the project, means that Tanner Street is now being fed from both sides and is being completely serviced by the new 8 inch diameter water main. Although Thursday was lost to the heavy rains and there was an unexpected problem with one of the traffic signals late on Friday, PACT Construction was able to complete the crossing of Haddon Avenue with the new 48 inch diameter concrete storm sewer piping.

For the upcoming week, PACT Construction will continue to work on installing the new storm sewer, including several large chambers that will be installed adjacent to the Library Point area of the project.
